

## **Developers Documentation**

### **Coding Issues**

- **Frontend**

- Seller page: Designing the seller page is taking more time than expected. To implement the design, we also have to integrate with the styles listed in the template. It is taking time to check if the code already exists for the CSS.
- Product listing page: we were able to implement the product listing page using dummy data. The backend API integration is still in progress, so we haven't been able to send API requests to get real-time data yet.

- **Backend**

- Understanding the query implementation of MongoDB using mongoose in node.js. Basically getting acquainted with how to query on documents in MongoDB database.
- Deciding the data model of Product collection since it is the heart of the project, so needs to cover future scope.
